Citizen Science projects for you

Be a Citizen Scientist with SeasonWatch

Are you curious to know how we can observe climate change ourselves? It may be as simple as looking at the tree outside your window!

Trees produce new leaves, flowers, fruits, and shed old leaves according to seasons. Each stage of leaves, flowers, and fruits is called 'phenophase'. Observing the timing of these phenophases can tell us about the impact of the changing seasons due to climate change.

Follow these 3 simple steps to study climate change through trees with **SeasonWatch**:

Observe

Upload

How to observe a tree?

-  Download the SeasonWatch Android app or go to www.seasonwatch.in and register yourself.
-  Select a tree from the list of SeasonWatch species. This tree should be old enough to produce flowers and fruits.
-  **Regular observation -**
In 'regular section', register a tree by adding its species, location. Give it a nickname and add other optional details. Add observations on this tree once every week.
-  **Casual observation -**
Tap on the 'eye' button in 'casual' section, select the tree species, add the location, and make an observation once.

Phenophases to observe

Leaves	Flowers	Fruits
  	 	 
Young, mature, old	Bud, open	Unripe, ripe, open

Recording phenophases

None: Phenophase **absent**

Few: Phenophase present in **one** section

Many: Phenophase present in **two/all** sections
